UNITED STATES PLANT PATENT APPLICATION
of
ALAIN A. MEILLAND
for
FLORIBUNDA ROSE PLANT NAMED 'MEIMANESK'

BOTANICAL/COMMERCIAL CLASSIFICATION

Rosa hybrida/Floribunda Rose Plant

VARIETAL DENOMINATION

cv. 'Meimanesk'

Summary of the Invention

The new variety of *Rosa hybrida* Floribunda rose plant was created by artificial pollination wherein two parents were crossed which previously had been studied in the hope that they would contribute the desired characteristics. The female parent (*i.e.*, the seed parent) was the product of the cross at the 'Interniki' variety (non-patented in the United States) and the 'Meinecta' variety (non-patented in the United States). The male parent (*i.e.*, the pollen parent) was the 'Meiquiza' variety (non-patented in the United States). The parentage of the new variety can be summarized as follows:

$$('Interniki' \times 'Meinecta') \times 'Meiquiza'.$$

The seeds resulting from the above pollination were sown and small plants were obtained which were physically and biologically different from each other. Selective study resulted in the identification of a single plant of the new variety.

It was found that the new Floribunda rose variety of the present invention

(a) exhibits a semi-erect growth habit,

- (b) abundantly forms attractive very double medium pink
tinted with green blossoms of the old rose type,
- (c) is particularly well suited for cut flower production
under greenhouse growing conditions, and
- (d) displays flowers of an exceptionally long life when cut
and placed in a vase.

The new variety well meets the needs of the horticultural industry and can be used to advantage for the commercial production of cut flowers under standard under glass cultural conditions.

The new variety of the present invention can be readily distinguished from its ancestors. For instance, the flowers of the new variety possess an old rose configuration with a substantial number of petals as illustrated. The petals of the 'Interniki' variety commonly number approximately 15 to 25 and are medium red in coloration. The 'Meinecta' variety forms conical-shaped buds and its flowers are smaller, pale ocher in coloration, and possess a classical cut flower configuration. The 'Meiquiza' variety also forms conical-shaped buds and its flowers are smaller, pale pink in coloration, and possess a classical cut flower configuration. The new variety forms globular shaped buds and flowers having an old rose configuration.

The new variety has been found to undergo asexual propagation in France by a number of routes, including budding, grafting, and cuttage. Asexual propagation by the above-mentioned techniques in France has shown that the characteristics of the new variety are stable and are strictly transmissible by such asexual propagation from one generation to another.

The new variety has been named the 'Meimanesk' variety.

Brief Description of the Photograph

The accompanying photograph shows as nearly true as it is reasonably possible to make the same, in a color illustration of this character, typical specimens of the plant parts of the new variety. The rose plants of the new variety were approximately two years of age and were observed during September while budded on *Rosa indica* understock and growing in greenhouses at Le Cannet des Maures, Var, France. Dimensions in centimeters are indicated at the bottom of the photograph.

Fig. 1 - illustrates a specimen of a young shoot;

Fig. 2 - illustrates a specimen of a floral bud before the opening of the sepals;

Fig. 3 - illustrates a specimen of a floral bud at the opening of the sepals;

- Fig. 4 - illustrates a specimen of a floral bud at the opening of the petals;
- Fig. 5 - illustrates a specimen of a flower in the course of opening;
- Fig. 6 - illustrates a specimen of an open flower - plan view - obverse;
- Fig. 7 - illustrates a specimen of an open flower - plan view - reverse;
- Fig. 8 - illustrates a specimen of a fully open flower - plan view - obverse;
- Fig. 9 - illustrates a specimen of a fully open flower - plan view - reverse;
- Fig. 10 - illustrates a specimen of a floral receptacle showing the arrangement of the stamens and pistils;
- Fig. 11 - illustrates a specimen of a floral receptacle showing the arrangement of the pistils (stamens removed);
- Fig. 12 - illustrates a specimen of a flowering stem;
- Fig. 13 - illustrates a specimen of a main branch;

Fig. 14 - illustrates a specimen of a leaf with three
leaflets - plan view - upper surface;

- plan view - under surface, and

Fig. 16 - illustrates a specimen of a leaf with seven
leaflets - plan view - upper surface.

Detailed Description

The chart used in the identification of the colors is that of the Royal Horticultural Society (R.H.S. Colour Chart). The description is based on the observation of two year-old plants during August while budded on *Rosa indica* understock and growing in a greenhouse at Le Cannet des Maures, Var, France.

CLASS: Floribunda.

PLANT:

<i>height</i>	--	approximately 130 cm on average.
<i>width</i>	--	approximately 30 to 40 cm on average.
<i>habit</i>	--	semi-erect.

BRANCHES:

thorns

- *size*: variable (as illustrated).
- *quantity*: on 15 cm of young stems
approximately 1 on average greater than 5 mm in length and approximately 17 on average less than 5 mm in length.
- *configuration*: relatively straight on the upper surface and concave on the under surface.

LEAVES:

stipules

- adnate, pectinate, broad, approximately 1.3 cm in length on average, and approximately 1 cm in width on average.

petioles

- *upper surface*: glandular, medium green, near Green Group 137B and 137C.
- *under surface*: commonly bear a few prickles.
- *length*: approximately 1.5 cm on average with the terminal leaflet.

leaflets

- *number*: 3, 5 (most often), and 7.
- *shape*: somewhat ovate with an obtuse base and a cuspidate tip.
- *size*: terminal leaflets commonly measure approximately 3.5 cm in length and approximately 3 cm in width on average.
- *serration*: simple and regular (as illustrated).
- *general appearance*: rather dense, and medium green with a dull aspect.
- *color (young foliage)*:
upper surface: near Green Group 137A.
under surface: near Yellow-Green Group 147B and 147C.

INFLORESCENCE

number of flowers

- commonly in clusters of 2 to 7 flowers per stem.

peduncle

- hairy with tiny prickles, and the length is approximately 5 cm on average.

sepals

- *configuration*: elongated, two sepals commonly possess no extensions, and three sepals commonly possess weak extensions.

buds

- *shape*: globular.
- *size*: small (as illustrated).
- *length*: approximately 2 cm on average.
- *color*:

upper surface: as the calyx breaks near Orange Group 27A and 27B suffused and veined with Yellow-Green Group 145A together with a major suffusion of Yellow-Green Group 145A.

under surface: near Orange Group 27A and 27B broadly suffused Red Group 48D and veined with Yellow-Green Group 145A together with a major suffusion of Yellow-Green Group 145A.

flower

- *shape*: old rose type.
- *color (when blooming)*: medium pink tinted with green.
- *fragrance*: none.
- *petal number*: very double (as illustrated) with a large number of petals.
- *petal arrangement*: imbricated.
- *lasting quality*: exceptionally long. The blossoms commonly last approximately 28 days on average on the plant, and approximately 21 days on average when cut and placed in a vase.
- *receptacle*: smooth, and funnel-shaped in longitudinal section.
- *hips*: none observed to date under greenhouse growing conditions.

DEVELOPMENT

<i>vegetation</i>	--	medium strength.
<i>blooming</i>	--	abundant and nearly continuous.
<i>resistance to diseases</i>	--	good under standard greenhouse growing conditions, especially with respect to Botrytis and Powdery Mildew.
<i>aptitude to forcing</i>	--	very good.
